PURPOSE:

The intent of this clinical policy is to ensure services are medically necessary

Please refer to the member's benefit document for specific information. To the extent there is any inconsistency between this policy and the terms of the member's benefit plan or certificate of coverage, the terms of the member's benefit plan document will govern.

POLICY:

Benefits must be available for health care services. Health care services must be ordered by a provider. Health care services must be medically necessary, applicable conservative treatments must have been tried, and the most cost-effective alternative must be requested for coverage consideration.

GUIDELINES:

Medical Necessity Criteria – requests for intra-hepatic radiation therapy (transarterial radioembolization [TACE]) with yttrium-90 microspheres - Must satisfy any of the following: I - VI

- I. Primary hepatocellular carcinoma (HCC) that is unresectable⁸; or
- II. Unresectable liver metastases from primary colorectal cancer¹²; or
- III. Primary hepatocellular carcinoma (HCC) as a bridge to liver transplantation (ie, meets transplantation guidelines but awaiting donor)⁸; or
- IV. Hepatocellular carcinoma (HCC) *downstaging* (ie, does not meet transplantation guidelines)⁸; or
- V. For treatment of neuroendocrine cancers involving the liver – must satisfy any of the following: A – B
 - A. Carcinoid tumors – after failure of systemic therapy with somatostatin analogues (SSAs) octreotide or lanreotide to control carcinoid syndrome (eg, debilitating flushing, wheezing and diarrhea)⁹; or
 - B. Pancreatic endocrine tumors with liver-prominent disease¹¹.
- VI. Unresectable intrahepatic cholangiocarcinoma.¹⁰

EXCLUSIONS (not limited to):

Refer to member's Certificate of Coverage or Summary Plan Description

DEFINITIONS:**Downstaging:**

Decreasing the size, extent of metastases, and/or lymph node involvement of a tumor by means of therapy

BACKGROUND:

Selective Internal Radiation Therapy (SIRT), also known as radioembolization, is a procedure in which tiny radiation filled beads, called microspheres, are delivered directly to the tumor. The microspheres are delivered through a catheter placed in the femoral artery and threaded through the hepatic artery to the tumor site. The microspheres contain yttrium-90. Examples of this type of treatment include: SIR-Spheres, and Theraspheres, which are spheres made of glass. May also be known as transhepatic arterial radiation therapy (TARE). See Attachment A.
