**PURPOSE:**

The intent of this clinical policy is to ensure services are medically necessary.

Please refer to the enrollee's benefit document for specific information. To the extent there is any inconsistency between this policy and the terms of the enrollee's benefit plan or certificate of coverage, the terms of the member's benefit plan document will govern.

**POLICY:**

Benefits must be available for health care services. Health care services must be ordered by a provider. Health care services must be medically necessary, applicable conservative treatments must have been tried, and the most cost-effective alternative must be requested for coverage consideration.

**GUIDELINES:**

Requests for proton beam therapy must satisfy the following: I or II

- I. American Society for Radiation Oncology Model (ASTRO) Policies. Proton Beam Therapy (PBT) <https://www.astro.org/ASTRO/media/ASTRO/Daily%20Practice/PDFs/ASTROPBTModelPolicy.pdf>; or
- II. National Comprehensive Cancer Network (NCCN) Clinical Practice Guidelines.

**EXCLUSIONS (not limited to):**

Refer to member's Certificate of Coverage or Summary Plan Description

Includes, but is not limited to, health care services designated by the CMS Medicare program as Coverage with Evidence Development (CED) are considered investigative (see Investigative Services [MP/I001])

Proton beam therapy is investigative for treatment of primary prostate cancer (see Investigative List)

**BACKGROUND:**

Proton therapy, also called proton beam therapy, is a type of radiation therapy. It uses protons rather than photons (x-rays) to treat cancer.

A proton is a positively charged particle. At high energy, protons can destroy cancer cells. Doctors may use proton therapy alone. They may also combine it with x-ray radiation therapy, surgery, chemotherapy, and/or immunotherapy.

Like x-ray radiation, proton therapy is a type of external-beam radiation therapy. It painlessly delivers radiation through the skin from a machine outside the body.

In proton beam therapy, a machine called a synchrotron or cyclotron speeds up protons. The high speed of the protons creates high energy. This energy makes the protons travel to the desired depth in the body. The protons then give the targeted radiation dose in the tumor.

With proton therapy, there is less radiation dose outside of the tumor. In regular radiation therapy, x-rays continue to give radiation doses as they leave the person's body. This means that radiation damages nearby healthy tissues, possibly causing side effects.

Prior Authorization: Yes, per network provider agreement
